RE: Request for Information on the Development of an Artificial Intelligence (AI) Action Plan

Dear Mr. D'Souza:

Health care has leveraged AI for decades and the emergence of more advanced AI technology offers great potential balanced with reasonable concerns. President Trump returns to the White House at a critical time for enacting AI policies that promote privacy, safety and improved outcomes in health care, with patient outcomes and experience as our north star. The Alliance of Community Health Plans (ACHP) appreciates the opportunity to share our vision for the future of AI in health care.

ACHP is the only national organization promoting the unique payer-provider aligned model in health care, delivering affordable, coordinated and comprehensive coverage options. Our member companies collaborate with their provider partners to deliver higher-quality coverage and care to tens of millions of Americans in nearly 40 states and D.C. Anchored in their communities, ACHP member companies understand the transformative impact of an integrated system of care, in which providers, payers and community leaders work together to enhance access to services and improve health outcomes.

An effective AI Action Plan must account for sector-specific needs and impacts while allowing individual AI-enabled tools to be regulated appropriately based on their industry and application. It is critical to recognize that AI and the sectors that utilize it are both too complex for "one-size-fits-all" policy. As part of the Consumer Technology Association's Health AI Collaborative, ACHP emphasized the need for specialized policy in its December 2024 brief, [*Policy Considerations for a New Congress and Administration*](#).

When implemented at scale across the health care industry, advanced AI technology has the potential to enhance accessibility and improve quality of care. AI-supported technology eases administrative burden on both payers and providers, facilitates critical health plan operations and improves health care delivery and outcomes for patients. **ACHP encourages the Administration**

to develop an action plan that prioritizes patient outcomes and experience while promoting privacy, safety and technology accessibility.

An AI action plan must address the significant concerns surrounding the privacy of personal health information, patient safety, data quality and risk of AI use case within the health care system. Ensuring data quality, volume and hygiene is a critical element given the potential for AI models to ingest incomplete, inaccurate or poor-quality health care data. This raises significant concerns regarding AI model training, performance and implementation, creating disparities between those who can develop, access and implement AI and those who cannot. **AI action plan policies must support both greater health care data access and robust data protection measures, especially where data falls out of the purview of HIPAA protections.**

ACHP outlines three guiding principles that must be reflected in an AI action plan for the appropriate and effective oversight of AI in health care: protecting patients, the use of a common language and the necessity for public-private coordination.

Protecting Patients

The value of AI models and quality of the outputs rely on the original data, which in health care that typically means personal health information. It is imperative that this data is used responsibly, and patient privacy is maintained. High-quality data is also vital to ensuring AI does not impair the personalization of care or the recognition of community-specific trends. **ACHP requests that the action plan includes clear guidelines for how existing security and privacy requirements apply to data being used by AI, and to ensure that data sets are clean and representative to facilitate effectively tailored care.**

A Common Language

There is no consensus on definitions in AI within health care. Additionally, the distinction between predictive AI and generative AI models is not widely understood between consumers, policymakers and the health care industry. **ACHP requests the action plan determine a common language for AI in health care that would eliminate any ambiguity, ensuring that all stakeholders have a shared understanding as policy evolves.**

Public-Private Coordination

Health care regulations governing payer lines of business, patient and consumer protections, hospitals and providers are siloed between states and federal agencies. The result is a fragmented policy landscape that is challenging to navigate. Policymakers should avoid reinventing the wheel and instead refine existing policies and frameworks based on industry input, ensuring a seamless

expansion of the regulatory landscape. **ACHP requests the action plan to maintain a coordinated effort with stakeholders to establish seamless national policies and guardrails that enhance the use of AI in health care.**

From improving decision-making, streamlining processes and enhancing care coordination and patient access, ACHP member companies recognize the potential of advanced AI in health care. AI has supported the health care industry for decades, and the next wave of innovation can further ease the burden of routine tasks for health plans and providers, allowing them to focus on what they do best – delivering high-quality, coordinated care. ACHP strongly supports the positions outlined in the CTA Health AI Collaborative: [Policy Considerations for a New Congress and Administration](#) and encourages the Administration to develop AI policies that ensure AI-supported health care offers more seamless, improved access and higher value coverage and care to all patients.

ACHP looks forward to continued collaboration in the development of an AI action plan with this Administration. Please contact Michael Bagel, Associate Vice President of Public Policy at [REDACTED] with any questions or to discuss our recommendations further.

Sincerely,

Dan Jones
Vice President of Federal Affairs
ACHP
