

PUBLIC SUBMISSION

As of: March 21, 2025
Received: February 25, 2025
Status: [REDACTED]
Tracking No. m7k-wssd-mqti
Comments Due: March 15, 2025
Submission Type: API

Docket: NSF_FRDOC_0001

Recently Posted NSF Rules and Notices.

Comment On: NSF_FRDOC_0001-3479

Request for Information: Development of an Artificial Intelligence Action Plan

Document: NSF_FRDOC_0001-DRAFT-0946

Comment on FR Doc # 2025-02305

Submitter Information

Name: Brian Poissant

General Comment

- 1. Human Oversight & Control must be in place for all policies, automation, development and execution of all tasks that have AI at any point within its process.**
AI must always have human-in-the-loop systems, especially for critical decisions (e.g., healthcare, military, finance, automation). Autonomous AI must have clear, predefined limits and emergency shutoff mechanisms in place.
- 2. Ethical & Transparent Development**
AI systems must be explainable, meaning humans must understand the exact thought process of how AI develops its responses. Developers must follow, and be audited for strict ethical guidelines, ensuring fairness, accountability, and avoiding any trace of bias. Independent audits of AI systems must be in place to prevent unintended consequences.
- 3. Regulation & Legal Frameworks**
All Governments and international bodies must establish clear laws on AI's permissible uses as a global effort. A global AI ethics council (similar to nuclear or bioethics groups) could ensure responsible development, and provide an audit process for ensuring compliance. Companies must be required to disclose all AI risks and undergo regulatory and rigorous safety testing before deployment of any solution that enables, leverages or builds on AI.
- 4. Limiting AI's Autonomy in Critical Areas**
AI must not have any actual or virtual control over nuclear weapons, military strategy, or critical infrastructure without multiple human intercepts. AI must not be allowed or have the ability to rewrite its own core objectives (avoiding runaway AI scenarios).
- 5. Economic & Social Impact Management**
Corporations and Governments must establish programs to retrain/support workers displaced by any automation. AI must be used to enhance human productivity, not just replace jobs without consideration for workers. Ensuring AI-generated wealth benefits society rather than oligarchs.
- 6. Cybersecurity & Defense Against Rogue AI**
AI safety research must immediately focus on preventing the hacking or misuse by malicious actors. Strict encryption and cybersecurity protocols must protect AI systems from being manipulated, trained, re-trained, or deployed against the original human protective protocol it was deployed for. International cooperation to prevent AI arms races or misuse in warfare.
- 7. Deploy AI strictly for general human population Benefit**
AI development must focus on improving general human well-being, such as in medicine, education, and environmental protection. Protocols must be in place to quantify and ensure that AI is not benefiting businesses, governments and corporations. Governments must create public AI projects to ensure AI serves all of humanity. Corporations must be allowed to leverage AI for improvement of their operations and offerings. Corporations must not be allowed to leverage AI for human identification, prediction of any future of any human, prediction or manipulation of any monetary transaction, nor any "likely" diagnosis that will impact the livelihood or well being of any human.
