General Comment

As a software engineer closely following the trajectory of AI hype on my industry, I was frankly horrified to see the recent revocations of regulations regarding AI development. While certainly impressive in tech demos, the purely-probabilistic nature of AI models makes them deeply unreliable for reasoning or factual recall (see https://www.cjr.org/tow_center/how-chatgpt-misrepresents-publisher-content.php for one such example).

So then, what are these AI systems good for? At best, they're usable for two things. The first is unaccountable rubber-stamping, a measure that makes it much harder to hold corporate or government leaders accountable for their actions and represents a major backslide in legal protections for our citizens. The other, of course, is plagairism laundering, which allows large corporations to steal the labor of hard-working American artists and sell off reconstructed similes. This isn't an exaggeration, either, as rote memorization of training data is already a commonly-cited concern with generative AI. What companies like OpenAI seek isn't to innovate - it's to ravage the landscape of American intellectual property to make a quick buck.

Additionally, the recent stumbles in American AI development have far less to do with regulation and far more to do with mismanagement, given the venture-capitalist obsession with dumping ever-increasing sums of money into making bigger models with minor bells and whistles attached. Remember, DeepSeek ran circles around these companies simply by focusing on efficiency - all while being based in China, a country with significant regulations and restrictions on AI.

I am deeply disappointed to see an administration once famed for "draining the swamp" continue to sink deeper and deeper into corrupt backroom dealings with corporate oligarchs. I hope that the administration will reconsider their approach and reinstate much-needed protections for the small business owners and creatives that make our country great.
