## General Comment

To whom it may concern,

As a concerned American citizen who works in marketing and childcare, this is my response to the administration's call for public comment on how to move forward with its national AI policy plan.

The first of two recommendations for the administration are to apply its "hands-off" approach to state AI regulations as much as it does to federal policy. The administration has long advocated for states rights and should continue that path in allowing state government to determine what is best for their constituents.

The second and more important recommendation is to reject the calls for weakening copyright laws. If the administration is serious about supporting innovation, it will leave copyright laws alone. Many of the larger AI labs and tech-oriented think tanks are advocating for weakened copyright laws on the basis of national security. However, for the purposes in which the U.S. government has expressed interest in the use of AI, training on copyrighted works is not necessary for protecting national security or promoting scientific innovation.

Copyright laws, in and of themselves, actively promote innovation by allowing anyone to be able to earn a living off of what they create and contribute. If rightsholders are not able to protect those copyrights or control how and where they are used, it decreases the number of copyrighted materials produced due to the lack of protections, which inevitably harms innovation rather than encourage it. The administration's pro-innovation push benefits more from enforcing its currently existing copyright laws rather than attempting to weaken them to the benefit of Big Tech, which the administration has actively promised to hold accountable.

Numerous research papers among AI researchers, the true backbone of the AI industry, have shown that the bottleneck for AI dominance is the lack of data-efficient learning algorithms, not lack of data itself. America's AI edge is not negatively impacted by upholding the copyright laws that have been in our Constitution since its inception and goes much further towards encouraging innovation than if rightsholders are told they do not have a say in how their copyrights are used.

If America really wants to beat China in the AI race, it should recognize that what has truly kept us ahead is our adherence to the inalienable rights bestowed on us by our Constitution, the same inalienable rights China lacks. America should not rush to become China in order to beat China. A nation is its citizens, not its companies.

We the People appreciate the Office of Science and Technology's attention to this matter.
