Alexandria, VA 22314

**Re: Request for Information on the Development of an Artificial Intelligence (AI)
Action Plan**

Dear Mr. D'Souza,

The Internet Infrastructure Coalition (i2Coalition) appreciates the opportunity to submit comments in response to the above-referenced Request for Information (RFI) regarding the development of an AI Action Plan. i2Coalition represents the companies that build and maintain the essential infrastructure of the Internet, including web hosting, data centers, cloud computing, domain name services, and managed services. As the backbone of AI development and deployment, our industry plays a critical role in ensuring that AI innovation is scalable, secure, and globally competitive.

AI and the Role of Internet Infrastructure:

AI is increasingly dependent on the physical and digital infrastructure that our members provide. AI models require robust computing power, data storage, and network bandwidth, all of which are supported by the infrastructure sector. The AI Action Plan must account for the needs and challenges faced by this sector to ensure that the United States remains the global leader in AI development and deployment.

AI-Driven Network Security and Cyber Resilience:

AI is both a tool and a target in cybersecurity, and AI-powered network monitoring enhances threat detection and mitigation. The AI Action Plan should encourage investment in AI-driven cybersecurity for infrastructure providers and support international collaboration on AI security

DISCUSSION DRAFT: DO NOT DISTRIBUTE

standards to prevent cyber threats targeting AI data centers and networks. Developing AI governance frameworks that account for the risks of adversarial AI and model poisoning attacks that threaten infrastructure integrity is critical.

Balanced Export Controls for AI Infrastructure:

AI infrastructure is a key competitive advantage for the U.S., and export control policies should protect national security without hindering innovation. Export controls should be precisely targeted to prevent adversarial access while maintaining the ability of U.S. companies to expand AI infrastructure globally. Providing clear, transparent criteria for designating restricted technologies is necessary to avoid uncertainty that could hinder investment in AI infrastructure. Investing in AI-powered supply chain monitoring will help prevent illicit technology transfers while enabling legitimate business operations.

Promoting Open and Interoperable AI Infrastructure:

AI relies on open Internet infrastructure and the ability to access publicly available data. The U.S. must avoid overregulation that limits the ability of AI models to be trained on publicly available data and ensure that U.S. data center policies align with global standards to maintain interoperability. The U.S. should also push back against restrictive international policies, such as excessive AI model licensing requirements, that disadvantage U.S. businesses.

Workforce Development for AI Infrastructure:

The growth of AI requires a skilled workforce capable of managing next-generation data centers. The AI Action Plan should expand workforce training initiatives focused on data center operations, AI model deployment, and cybersecurity. Supporting visa programs that allow AI infrastructure companies to recruit highly skilled technical talent globally is necessary. Additionally, investing in education programs that prepare workers for careers in AI infrastructure, including data center management and cloud architecture, will help maintain the industry's leadership.

Ensuring Sufficient Energy Resources for AI Workloads:

AI workloads are energy-intensive, requiring scalable and sustainable energy solutions for data centers. The U.S. government should adopt policies that support investment in grid modernization and transmission capacity to prevent bottlenecks in AI data processing. Streamlined permitting for energy infrastructure supporting AI data centers, including nuclear and renewable energy sources, is necessary. Additionally, equitable electricity pricing should be maintained to prevent discriminatory rate structures that disproportionately burden AI infrastructure providers.

Conclusion:

As the foundation of AI innovation, the Internet infrastructure industry must be a key stakeholder in AI policy development. i2Coalition urges the U.S. government to prioritize policies that support AI infrastructure growth, enhance cybersecurity, and maintain America's leadership in AI development. We appreciate OSTP and NITRD NCO's efforts to engage stakeholders in this process and look forward to continued collaboration.

Respectfully submitted,

Christian Dawson
