General Comment

Artificial Intelligence development continues to race forward at a pace. We are not far off Artificial Superintelligence (ASI). The development of ASI poses an unprecedented security threat; a threat to the ongoing survival of the human race, no less.

Please heed the world's foremost AI experts in academia and industry, when they warn of the existential threat ASI poses (see safe.ai/statement-on-ai-risk). This is not a technology that can be safely developed by anyone, be they an individual, a company or or a nation. Not even the great country of the United States of America.

The leaders of the largest AI companies (OpenAI, Google, Anthropic) are engaging in supreme hubris in thinking that they alone can create _safe_ superintelligent AI. Especially considering the double-digit percent risk of human extinction they talk about; a risk that neither US citizens nor citizens of the rest of the world have consented to taking, and one that exceeds safety thresholds for industries such as nuclear and aviation by a factor of well over a thousand, with stakes far _far_ higher (the lives of every man, woman and child).

In order to safeguard both national and global security, it is paramount that the US lead efforts to prevent ASI from being built anywhere in the world. A bilateral agreement with China (second only to the US in AI capability) will be key to this. The last thing we need is to race to the brink of catastrophe, and beyond, with China, when such a race to ASI is a suicide race by nature.

This will be a very tough challenge, given the nature of the threat. To compare it to nuclear arms control is to fall short - a more apt analogy would be if a single nuclear detonation would in fact end up burning off the entire atmosphere (as Manhattan Project scientists feared as a possibility at one point), _and_ nuclear weapons had a tendency to spontaneously self-detonate. In such a world, the only way for the human race to survive is to have a well-enforced global non-proliferation treaty that ensures that no nuke is ever built.

The same applies now, in real life, to the building of ASI. Challenging as it may be to prevent it, I believe the US government is up to task. Please act swiftly.
