General Comment

The AI industry in the United States has shown blatant disregard for copyright and intellectual property law, stressed grids their hastily assembled data centers cause on communities, or the consequences of their actions on any number of industries. They will ask for a permission to harvest the work of every professional in the United States without compensation or permission, force their data harvesting software into every tool we use across every industry they can with no regard for the law or damage they deal to real people and their livelihoods. We know this because they're already doing it.

Any support or neural nets and similar technologies must come with assurances that these companies will not be allowed to run roughshod over our creative and technical industries. American culture is one of our most powerful exports, and AI companies will be all too happy to decimate it for short term gain.

It should be said that such protections are in the best long-term interest of the AI industry itself. The current "move fast, break things" model cannot sustain an industry for long, and being forced to solve these issues with data harvesting and IP theft will shape the technology in a way that it can continue to grow alongside our strong cultural industries, rather than burning out as it already begun to do as AI companies resort to more and more desperate attempts to bolster their data sets.

I make these comments both as an artist and a professional software developer. I know the White House is likely to go ahead with some AI development plan regardless of comments, so I implore NSF to do so with care and consideration of the troublesome behavior already exhibited by AI companies.
