General Comment

As a creative and as a human being concerned with the state of both our country and planet, please do not take any steps towards removing guard rails on AI. Frankly, I think we should be limiting it instead of pushing it forward.

AI in a general sense has many excellent uses that can forward humanity--developing AI to assist in medical research and identifying patterns that are unrecognizable to humans but allow us to catch cancer as early as possible, for instance, is a fantastic thing to be working on. However, my concern is that much of the recent push has been for generative AI.

Generative AI is a power hungry, water hungry machine that eats works created by others and spits out generic versions. The environmental impact of training these models is enormous, and we can't afford it in addition to all the other ways we refuse to care for the planet. We are building servers in places that cannot afford to lose the water it requires.

Not to mention that it is already being used by people to try to replace creatives. In spite of it creating largely very boring, very same-y writing, and in spite of the art it makes being gummy and built entirely out of the visuals of other talented artists, it is being seen as a good tool. It is not a good tool. People can tell when a human was not involved. The reception has been extremely poor.

And that's to say nothing of the copyright issues. It is not acceptable to use people's copyrighted work to train these models. They are a black box, and pretending that you know, definitely, that they aren't just outright stealing work is absurd.

Finally, this same technology is being used to create entirely fake images that are being used to mislead and lie to people. It is being used to create fake sexual images to get "revenge" on people. The idea that anyone would want to further development of a technology that can be, is being, and will continue to be used in such hideous ways is beyond me.

Please ensure that any AI research and development is focused where it matters, on technologies that are both something AI actually excels at and that actually improve the human condition, and don't spend the environment on trying to generate "human-sounding" writing or "human-caliber" art when there are humans right there that can accomplish those things better than AI ever could.
