General Comment

the largest part of the artificial intelligence debate is where is it being used. if it's being used as a part of a specific closed system (for instance in a software to make engineering physical parts easier) it works well.

But for instances where it's just scraping data to regurgitate an answer and remove any basis for human thought (where it's being forced into these search applications and social networks) it has kind of been a scourge on humanity. it's not really helping anyone when it's removing the need to critically think for oneself. Until the systems themselves can fact check, cross-reference, and weed out the false, misleading, and satirical information from the data set it parses, they will continue to be a danger to society. Too frequently these systems propagate false and misleading information that get published to social medias and disseminated by well meaning but misinformed, individuals as 'fact'.

Without proper safeguards we risk the further dissemination of untruths. We risk that technology being used by bad actors against the country and the democracy we dearly love.
