Organization: OHSU

General Comment

Dear colleagues:

On January 23, 2025, President Trump signed Executive Order 14179, “Removing Barriers to American Leadership in Artificial Intelligence,” to establish U.S. policy for sustaining and enhancing America's position as a leader in AI through the development of an AI Action Plan focused on human flourishing, economic competitiveness, and national security. At the invitation of the Office of Science and Technology Request for Information, we are writing to share policy ideas for the AI Action Plan with a focus on improving American competitiveness, health and healthcare.

We recommend three key actions to support responsible AI development and adoption in healthcare: 1) a Foster strong partnerships between health systems and AI developers to build trust, improve accuracy, and ensure continued innovation.; 2) Make high-quality benchmarking datasets—such as those from Bridge2AI—widely available for model training and carefully controlled for realistic testing.; 3) Apply the same security, privacy, and transparency standards to both AI developers and the health systems that use their technology. These steps will help create a robust, trustworthy AI ecosystem that accelerates innovation, strengthens market competitiveness, and delivers meaningful benefits to patients and healthcare providers.

We have attached a file with details.

Sincerely,

David Dorr, Shannon McWeeney, Bridget Barnes, Paul Allen, Robin Champieux, and Karen Eden; Oregon Health & Science University

On January 23, 2025, President Trump signed Executive Order 14179, “Removing Barriers to American Leadership in Artificial Intelligence,” to establish U.S. policy for sustaining and enhancing America’s position as a leader in AI through the development of an AI Action Plan focused on human flourishing, economic competitiveness, and national security. At the invitation of the Office of Science and Technology Request for Information, we are writing to share policy ideas for the AI Action Plan with a focus on improving American competitiveness, health and healthcare.

We recommend three key actions to support responsible AI development and adoption in healthcare: 1) a Foster strong partnerships between health systems and AI developers to build trust, improve accuracy, and ensure continued innovation.; 2) Make high-quality benchmarking datasets—such as those from Bridge2AI—widely available for model training and carefully controlled for realistic testing.; 3) Apply the same security, privacy, and transparency standards to both AI developers and the health systems that use their technology. These steps will help create a robust, trustworthy AI ecosystem that accelerates innovation, strengthens market competitiveness, and delivers meaningful benefits to patients and healthcare providers.

1. Model development

Models need realistic, representative data to be effective Health data is constrained by privacy needs, limiting its accessibility for innovation. To address this, the U.S. should invest in more open, AI ready datasets available to US citizens, fueling advancements while maintaining strong privacy protections. The Bridge2AI program is an excellent example of the generation of these datasets and is ready to generate more effective models. Additionally, strengthening partnerships between health systems and AI developers will help the U.S. maintain its competitive edge. These collaborations ensure that models are trained on substantial, high-quality data and receive the necessary support for safe and effective development. Given the complexity and variability of health data, continuous fine-tuning is essential. To promote responsible adoption, mechanisms for assessing model safety should be in place, enabling health systems to confidently integrate AI innovations.

2. Application and use

The rapid advancement of AI models has already led to significant investment, over \$30b in the health sector alone. However, as with model development effectively using these models to drive efficiency and improved health outcomes requires partnerships between model developers and health systems. The ARPA-H initiative known as PRECISE-AI intends to accelerate this innovation by addressing issues of trust, uncertainty and model performance in real-world settings. Assuring models are fair, accurate, valid, effective, and safe is necessary to drive uptake and use of AI and ensure a return on investment. Investing in approaches that drive this uptake is crucial to achieve the value from AI, including a substantial transformation of health care to be

more person-centered and efficient. A fundamental issue for AI models is reliability and accuracy: ongoing use requires trust, and unknown errors raise significant liability concerns for the companies. Partnering with health systems, especially those with an academic component, will improve both trust and reduce liability. Encouraging these investments through government programs and regulations will ensure we retain a competitive advantage. Patient safety is a crucial consideration: models must be tested carefully in the real world to ensure ongoing safety. Expectations for ongoing evaluation and surveillance should be set.

3. Explainability and assurance of AI model outputs

For AI models to be widely adopted and deliver value, they must be explainable and trustworthy. Without confidence in their outputs, both financial investments and America's competitive advantage in AI risk being lost. Explainability is key not only for trust but also for maximizing the return on investment in AI development and implementation. As mentioned earlier, PRECISE-AI intends to enhance this trust by supporting efforts to assure model outputs through benchmarking and increase explainability and assessment of uncertainty through additional algorithms intended to both explain and quantify potential errors in the models. Without sustained investment in these efforts, the U.S risks falling behind in AI innovation and adoption

4. Cybersecurity

The impact of cybersecurity cannot be understated: efficient and effective ways to protect the privacy and security of patient data have to be implemented widely. However, current security requirements ask the impossible of health systems: to both completely protect data from any future breach and make the data available to models. Instead, trusted networks and pipelines for data to flow to AI/ML algorithms are required. To achieve this goal, a pragmatic approach to security is required. Foundational elements related to AI security should be applied evenly across the industry; currently, there are substantial differences in security requirements between HIPAA entities and non-HIPAA entities, such as AI companies. In addition, the increasing FEDRAMP requirements for security standards are a substantial burden and cost when they are applied to health systems; a pragmatic approach to the application of standards that doesn't increase cost and unnecessary burden would be helpful.

5. Data privacy and security throughout the lifecycle of AI system development and deployment (to include security against AI model attacks).

Collaborative agreements with innovative companies and health systems will inevitably require cloud-based exchange of information and model results. Specifically, standard language to address the risks and benefits of this exchange will improve the ability of institutions to test and implement new innovations for the benefit of all. Organizations that uniformly explain the risks and benefits to people seeking care should receive legal protection against risks, especially when they are incurred by the company that is creating or implementing models. This will ensure the ongoing development and implementation of models while balancing risks and to whom they accrue.

6. Regulation and governance

To have efficient and effective governance, regulations must set boundaries. A primary example is asking AI innovators to be transparent in how their model was built and tested, including known errors. Guidelines for governance should be set: in this way, organizations can work together to understand the foundation for governance. In addition, an industry can develop to make governance more cost-effective, especially for small hospitals and other care settings. Each organization and locality should define their own governance approach based on these guidelines. An effective governance model identifies the risks, benefits, implementation plan, and evaluation needed for local implementation. Support and guidance should be provided to enable these organizations to develop their own governance for the implementation, with an open and transparent exchange of best practices. Patients seeking care at health institutions should be informed about AI use and allowed to make their own decisions about the potential benefits and risks.

7. Technical and safety standards

Standards for AI development, testing, and implementation should be established. HTI-1 and HTI-2 represent a fair foundation for describing the use of decision support interventions, including AI. These modest standards – a 'model card' approach to describing the algorithms and how they are used will allow all people to evaluate how this model may be valuable to them.

8. Research and development

Industry-driven AI development has produced groundbreaking tools, but successfully integrating them into healthcare requires alignment between informatics, implementation science, and incentives. Encouraging an AI-enabled learning health system approach will accelerate research and development while ensuring the U.S. maintains its competitive advantage. Strong partnerships between AI developers and health systems are essential for fine-tuning models and maintaining quality over time. Without ongoing collaboration, AI models risk degradation as data shifts and algorithms evolve.

9. Education and workforce

AI tools appear to work exceptionally well but can contain significant errors. To ensure their safe and effective use, healthcare professionals must develop strong critical thinking skills to recognize and mitigate these errors. As AI becomes more integrated into healthcare, problem-solving and analytical reasoning will be even more essential.

Health education should evolve to reinforce these skills, ensuring that assessments and training emphasize critical thinking in the context of AI decision-making. By doing so, we can better prepare future healthcare professionals to navigate AI-driven tools with confidence and sound judgment.

10. Innovation and competition

Fundamentally, retaining the innovative edge in America requires ongoing, continued support and evaluation. Reducing investment in research will limit the impact of AI models in health, as trust will continue to be eroded and any errors will put industry at risk from lawsuits. To accelerate innovation, direct support must be provided to cross-sector teams that implement robust and rigorous evaluations of the tools and monitor trust.

If there are additional questions, we are available at the submitting address.
