General Comment

Hello,

I'm a software engineer working in the tech sector, and I must express my extreme displeasure at the uncritical support the President wants to throw behind generative AI.

It's a scam. The biggest investment scam in history.

The promise is a magic machine that can think and do anything like a human can. The reality is that it's a text auto-complete machine that eats the combined electricity and processing power of multiple data centers to incorrectly tell you to put glue on pizza. It does not know what you are asking. It does not know what it is saying in response. It is simply trying to figure out what the statistically most likely next word in a sentence is. It not only has minimal application due to its gibberish responses, poor grasp of factual information, and inability to understand feedback, it is also a MASSIVE security risk, in that users are freely submitting a bunch of information to whoever owns the AI. As such, no corporation in its right mind will permit using it. I work at a major entertainment software company, and our stance is: DO NOT USE CHATGPT EVER, because it is a huge security threat.

This isn't worth tossing copyright to the wind for. The chilling effect you would create by letting the fraudulent AI industry freely train on copyrighted data would be disastrous for the American economy, as individual creators would now be subject to rampant, unfettered abuse by tech giants. Sharing information, creative projects, even simple drawings will be discouraged so harshly as to put whole industries at a standstill, all to prop up a doomed product. It's at a dead end in terms of so-called "reasoning" ability, and an even worse dead end for financial solvency, as AI companies continue to waste billions on data centers that produce nothing.

Don't bail these losers out. Support real work by real Americans. If you want to put one over on China, make the US a safe place for innovators to share their work, not a haven for just one industry at the expense of all others. Uphold copyright.
