General Comment

Generative AI may have the appearance of learning, but it lacks actual mental processes. It's at best the big brother to your phone's autocomplete, and at worst, a plagiarism machine trained to steal others' work. It's insulting to creatives, a copyright nightmare for corporations, and losing popularity as quickly as NFTs did. Generative AI is worthless, and a poor substitute for a human worker in any position (with the possible exception of CEO - but to be fair, that's a job that doesn't require much brains or talent anyway).

That being said, it's important to note that there are forms of AI that are NOT generative - these forms of AI can be used to track cancer cells, pilot drones in space, and many more things that are beyond the capabilities of a person when lives hang in the balance. These forms of AI are useful to mankind, serving as a tool rather than a shabby replacement for human workers.
