General Comment

Subject: Achieving Artificial Intelligence Governance

Hi there!

Achieving national-level Artificial Intelligence (AI) governance can be realized through three core governance models: optimizing resource utilization in AI, mitigating risks associated with AI production and application, and increasing organizational benefits and profits. Below, I have outlined key considerations necessary for achieving these goals:

Optimizing Resource Utilization in AI Activities To accelerate the prevention of resource wastage in policymaking and execution, the following steps are vital:

While adherence to standards is beneficial, contradictions among them must be resolved. Otherwise, they risk becoming the primary source of resource wastage within companies and government sectors.

Many references are created by universities that have not engaged with practical applications, rendering them less effective in addressing real-world challenges.

All AI-related efforts must align with project management principles, ensuring tangible results—be it profit or goal realization—within specified timeframes and budgets. It is no longer viable to fund research ventures in the guise of corporate projects without accountability.

The principles and methods of software service production must be utilized when creating services.

Funding for repetitive tasks should be minimized. Often, while a project's title and problem statement may differ, execution methods rely on existing approaches, making it unnecessary to allocate full budgets. Instead, partial funding for enhancements suffices.

Integrating AI Risk Management for AI Governance Effective AI governance necessitates the alignment of AI with risk management. A specialized system can be designed to leverage these three critical elements, adding national value instead of inadvertently contributing to resource waste. I have developed such a system.

A formal authority for validating AI's inherent risks must be established, enabling organizations to utilize it without expending resources on identifying repetitive issues.

AI risk management terminology should be continually updated by a committee comprising universities and companies. Current leading universities in the United States often fail to distinguish adequately between issues, risks, and incidents in AI, and instead use these terms interchangeably, as observed in their most prominent articles and projects.

In summary, by implementing these measures, organizations and nations can ensure that AI governance not only drives efficiency and risk mitigation but also yields substantial and sustainable benefits.

Sincerely,
