Status: [REDACTED]
Tracking No. m8a-davr-hxaz
Comments Due: March 15, 2025
Submission Type: API

Docket: NSF_FRDOC_0001

Recently Posted NSF Rules and Notices.

Comment On: NSF_FRDOC_0001-3479

Request for Information: Development of an Artificial Intelligence Action Plan

Document: NSF_FRDOC_0001-DRAFT-1924

Comment on FR Doc # 2025-02305

Submitter Information

Name: Zac Fosdyck

[REDACTED]

General Comment

Hiya!

If the United States wants to maintain its leadership in AI and technological innovation, it must abandon outdated intellectual property (IP) models that are choking progress. The scarcity-based approach to innovation—where ideas are locked behind paywalls, patents, and corporate silos—is not just inefficient, it’s a death sentence for U.S. competitiveness in the 21st century.

The Information Age has fundamentally changed the game. Unlike physical goods, knowledge is not depleted when shared—it grows. AI thrives on open access to information, and nations that embrace collaborative, open-source models are accelerating past those clinging to proprietary systems. The European Union and China are investing heavily in open research ecosystems, ensuring that their brightest minds have unfettered access to the tools they need to innovate. Meanwhile, the U.S. is stuck in an economic model where corporations hoard knowledge like it's a finite resource, leading to stagnation instead of progress.

Let’s be real—capitalism doesn’t work without competition. But when a handful of companies own the rights to critical AI models, they aren’t competing, they’re fortifying monopolies. Innovation is being strangled under the guise of "protecting intellectual property," when in reality, it's about locking out the next generation of startups, researchers, and students who could be building the future. If we don’t reverse this, the U.S. will be outpaced by nations that are making their AI ecosystems accessible rather than artificially scarce.

We need an AI Action Plan that embraces abundance, not scarcity, and that means:

Open Access to AI Research – Publicly funded research should not be privatized. If taxpayers pay for it, they should benefit from it.

Reforming IP Laws for AI – AI-generated work is not "intellectual labor" in the traditional sense. We need laws that encourage iteration and improvement, not corporate ownership of algorithms.

Investing in Open Education – Knowledge must be freely accessible. The U.S. is losing its STEM edge because students and researchers are blocked from essential information by paywalls and licensing fees.

Preventing AI Monopolization – A few corporations should not control the infrastructure of knowledge. Break up anti-competitive AI monopolies before they cement their dominance.

Think about it: the internet, the ultimate free-market accelerator, was built on open protocols. GNU/Linux dominates global infrastructure not because it was locked down, but because it was free to evolve. The most dynamic, world-changing innovations did not come from walled gardens but from open ecosystems.

If we don’t adapt, we lose. Not to socialism, not to communism, but to the reality that knowledge economies cannot function under scarcity models anymore. If the US wants to stay ahead, it needs to get over its outdated fear of collective progress and start playing to win.

Thanks & Take Care Now
