General Comment

This proposition is a terrible idea for myriad reasons, but I'll lay out 3 key points below:

1. It's slower than human labor. AI requires an enormous amount of resources and drafts to create a product that still requires numerous revisions and human edits to reach something usable. Without strict and enforced regulation, it's very likely the processes and models we use today will waste energy and time while producing an increasingly inferior product to something 100% human-created. (See: 2024's Coca-Cola 15second ad spot that generated over 800 minutes of unusable material.)
2. It kneecaps businesses and IP. Generative AI and LLMs depend on the unrestricted use of copyrighted material, generally without the consent or agreement of the copyright holder. Not only does this violate the premise of copyright altogether, it reduces competitive advantages enjoyed by industry leaders at all levels of free enterprise. Further, it sets up US-owned works to be poached, bootlegged or otherwise befouled by foreign entities.
3. It's still too volatile to scale. AI as it is colloquially known today is only a fraction as powerful or agile as it needs to be to live up to any promises made by its primary investors and proponents (usually the same people.) The tech isn't where it needs to be to fulfill the sales pitch, and without strict and careful guidance, it risks becoming a prodigious source of mis/dis-information, file bloat, and shoddy infrastructure within tech.

The plan as stated sets up the US tech industry for failure, and should not proceed.
