## General Comment

As a small business owner, I believe there are ways to implement AI that can be beneficial, by streamlining automated tasks that are dull and repetitive such as calculations.

AI, however, used for generative AI purposes not only is not profitable, it hurts a small business like mine by stealing from me.

I believe the following needs to be considered:

1) That copyright law is built into the process and respected. We already have precedent; When Vanilla Ice sampled a large portion of Under Pressure, it wasn't remixing. It was deemed theft and thusly compensated. Napster almost killed the music industry. The courts correctly ruled that it was stealing music. The music industry did not collapse from enforcement of these laws. A similar licensing system, that is fully opt-in could easily be implemented and should be. Without copyright, without the protections of the law that allow us to create and keep what we've created, what incentive is there to create? And without content, there is no generative AI.

2) The power and might of the United States must be used to protect our intellectual property rights worldwide. Big tech companies or foreign governments should not have the ability to ingest our content, censor output, control the narrative, or profit from our work. Any company or country shown to engage in anything other than transparent, free, and compensated use of content should be subject to the harshest penalties. It is theft from U.S. citizens and rights-holders. The fact that some of the generated AI content is almost one-to-one replicas of the original content betrays their intent to take from small creatives and profit from it as a bigger company. It's unacceptable.

3) The energy consumption of these processes are far more devastating environmentally and wasteful than the sum of their output, which again, generative AI's output is theft from individual rights holders--small business owners and intellectual property that makes the United States unique and competitive. If the cost to run a light bulb is that it explodes and has to be replaced every 2 minutes, it's neither effective nor budget-friendly.

4) The interference of information is causing us to fall behind in the world as a leader in science and research. By allowing generative processes to take over certain sectors of information, we are losing the accuracy that allows us to continue to develop as a world leader. Pictures of animals are being replaced with inaccurate AI replicas so realistic in appearance that it causes confusion. Our proud history being erased and rewritten. Scientific journals publishing diagrams of things that don't exist. It cannot continue.

This is a powerful new technology. Now is the right time to make the right choices to keep America a leader in AI development and sustain content creation in a long-term manner. Without content, AI stagnates and fails. It just regurgitates what it's given. Plus, it's just the right thing to do.
