General Comment

First, let's address the elephant in the room. What is being called AI is not an artificial intelligence in the slightest. The term "AI" is 100% marketing and buzzwords used to deceive people without deeper knowledge of the software. Nothing labeled as AI is intelligent or can make decisions of any kind. All these various software are, in simplest terms, pattern recognition software that tries to fill in blanks. Dogs are smarter than ChatGPT. The results ChatGPT gives are the projection of the Wizard of Oz, but the inner workings are essentially a man behind a curtain. This bad joke is what techbros are desperately trying to make a use case for.

In terms of copyright and intellectual property, there is no fair use case for Silicon Valley's bad experiments. Why should desperate techbros be able to parasitize countless American artists, writers, entrepreneurs, and company IPs with zero compensation or permission to train their machines? Courts have already ruled that AI does not have the capacity to create useful bodies of works, and are not subject to copyright. If AI companies can't create the software they want without literally stealing from everyone under the sun, how is that fair use? That's their problem. Would I be allowed to break into your house, and gut all the copper pipes and wiring, as long as I told you I was building the next great snake oil machine with it? No, I would be arrested and called insane. There isn't much of a difference.

What these AI softwares will do though is gut the American economy, and force millions of Americans into unemployment. These machines will not create jobs. They will create untold problems.
