General Comment

I do not believe that generative AI, such as OpenAI or ChatGPT, provides any benefit to individuals or society at large. From what I have seen, these AI programs are faulty and prone to error. I once tested ChatGPT by asking it if 2333 is a prime number, and it said no, despite the fact the 2333 is in fact a prime number. Me and my friends also tested OpenAI once by asking it to write a short paragraph about Abraham Lincoln, and it did, but went off on this huge tangent about how you shouldn't trust everything that you read online. I've also seen plenty of memes about how Google's Gemini recommends making pizza with glue and such. What I'm saying is that it's going to take more than a CEOs word to convince me that these are accurate.

It's also going to take more than a CEOs word to convince me these AI programs are useful. Programs like Asana, Microsoft Teams, and Monday.com already help with making office workflow and project organizing. Google docs and Microsoft Word already have built in spell checkers. Physical calculators and calculator apps are everywhere. It may take some time to learn the specific functions on a scientific calculator, but why would I go to an AI program to do so when I can just fiddle with the calculator right then and there? In terms of archiving data, there's already millions of wikis on the internet that document basically every subject imaginable. Encyclopedia Britannica also has physical and digital copies of its books, as do many other publishing houses. What is the point of trying to archive all this data into one place again? Saving me 5 seconds when I google search a sourdough recipe is hardly something to celebrate. Basically every purported benefit or use of AI is already accomplished by something already on the market.

In short, I do not believe that investing billions of dollars into generative AI will NOT create marked improvements and is ultimately wasteful and inefficient.
