General Comment

I work for a company in the technology sector that has developed copyrighted software for use in mission critical spaces and SCIFs. It is paramount to both our economic success as a nation and our national security that AI companies NOT be allowed to train on copyrighted materials without clear prior consent protocols and financial compensation to rights holders. Any steps taken by the government to waive existing copyright law for AI software companies will disincentivize innovation. Shifting the regulatory environment to favor AI software companies will make it easier to create substitute software products that are cheaper, contain more cybersecurity vulnerabilities, and give our adversaries the tools to reverse engineer our products. What individual or company would want to innovate if years of work can simply be analyzed and exploited to make a cheap copy on behalf of an AI product user or the AI company itself? AI has value in its ability to train on open source materials and consenting rights holders, but it is ludicrous to think that subverting copyright law is in the best interest of the United States economy or defense posture.

It is doubly important that AI products not be allowed to train on any software products being deployed in SCIFs, or on software products that process Controlled Unclassified Information or Personal Identifying Information. The risks to our national security presented by this would be unprecedented.
