General Comment

I am strongly opposed to the development of this AI action plan. It would be highly detrimental to small businesses and artisans which I'm confident the current administration has little interest in, so to give you incentives you actually care about, AI is full of erroneous data. One need simply look at the drastic decline in the quality of Google search results which are often full of factually incorrect information to see this is ill advised.

Furthermore, pursuing AI would open up corporations looking to exploit trained data to their own copyrighted assets being exploited and beyond this, consumers trust AI based products less. Dogan Gursoy, the author of a study into AI products (see: <https://www.tandfonline.com/doi/full/10.1080/19368623.2024.2368040>) said "In every single case, whenever we mentioned 'AI' vs 'high tech', consumers' purchase intention went down."

The white house site says "With the right governmental policies, continued U.S. AI leadership will promote human flourishing, economic competitiveness, and national security." but the current administration could not possibly be more poorly equipped to handle such aspirations without negative consequence. As previously stated, consumers often avoid AI based products, there is no economic competitiveness to be gained. And the idea of basing national security on AI is dangerously ludicrous.

AI search results have suggested making pizza with glue, eating rocks for nutritional health confusing satire for genuine advice, and mixing chlorine bleach with white vinegar in laundry which creates toxic gases. What dominance could we possibly derive in national security from systems that can't tell the difference between legitimate medical advice and jokes posted by Reddit users?

All of this on top of Elon Musk chaotically stampeding through our government like a blindfolded bull through a china shop with incredibly obvious bias, this administration is wholly incapable of scrutinizing or drafting AI policies with an intelligent and impartial eye.

If none of this persuades your self preservation to activate, consider the OceanGate disaster because the people trying to sell us all on AI dominance are the same people that will send you to the bottom of the ocean in an imploding submarine controlled by a logitech gamepad.

In short, the inaccuracies in AI and rampant public distrust are far more likely to damage economic competitiveness and national security than come anywhere close to promoting "human flourishing".
