## General Comment

The current AI action plan is fed into by monopolies insisting that they cannot function without copyrighted data that they have not been given consent to, as well as xenophobic and racist ideas about national security overblown by other countries having technology. These are overshadowing the actual fact that AI is a dying industry that no one other than a niche subgroup of moguls buys into anymore due to its inability to work as well as a human being - this has been tested in studies, and people can simply notice this.

AI can only perform as well as the code and training input into it, which is flawed, as humans are, and has biases unconsciously input into it with that in mind. If you're putting training data in by people who are xenophobic towards the Chinese and claiming that it's a matter of National Security to outperform them in technological aspects, you're going to make an AI that has training data that is biased against China. This has been proven since the dawn of technology.

You're going to have plenty of people informing you that your plan is replacing human workers and increasing energy cost massively, and it is. This is unethical for the sake of turning a profit. I do not think you care about that. My point, however, is that your machines aren't even good, and the bias you're going into this with is going to make them worse. The only way to make machine learning viable is to go in with a properly picked dataset, chosen by variables you actually know what you're inputting, not just scraped randomly from all of the internet for SECURITY, and typically from people who can actually consent so they can give you proper information for your tags. With not enough information your machine will be biased and zero in on people who didn't get enough information in on culprits of Absolutely Nothing Other Than Being Different. This will not actually function as a machine unless you train it ethically. I cannot tell you not to use the machine. I can tell you that I've actually asked people who run AI how it works and you're doing it wrong.
