General Comment

The act of letting "A.I." flourish on its own to help "Enhance America's AI Dominance" would do nothing but hinder the U.S. and the many creatives across the country who would suffer from so-called innovation in the field. Many creatives I know personally have been affected only negatively by the growth of A.I. creations, be they images or written pieces. Cutting out the middleman of this equation would not lead to more economic prosperity as suggested, but instead lead to less creatives, less innovation, less people with jobs and thus worse economy. By putting people out of jobs with "A.I.", many would not have the money to be able to survive in the current economic climate of the U.S. due to recent economic declines. This would lead to even less consumers, and thus companies would have an ever-decreasing pool of customers to advertise to, starting a collapse from the inside. The encouragement of A.I. to progress on its current path would make misinformation run rampant with newly generated false A.I. misinformation, such as what is currently occurring on websites such as 'X'. This misinformation, "A.I." generated videos, and images could lead to national security risks unlike those ever seen as entire documents and situations with photographic evidence could be created out of thin air. This would make verifying things as real even harder than they are in the modern day, and as is it is very hard to search anything online without finding thousands of fake images made with no point to them. It is, in this current "A.I." climate, where facts can be made up with accompanying evidence. At what point will the line be so hard to draw between real images and "A.I." fakes to where that fake images are used in court to accuse innocent victims?
