General Comment

Public Comment on Artificial Intelligence Action Plan

Submitted to: Networking and Information Technology Research and Development (NITRD) National Coordination Office (NCO), National Science Foundation

Date: March 15, 2025

To Whom It May Concern,

America faces a pivotal moment in Artificial Intelligence. With smart policies America will lead in AI while continuing to uphold free markets, fair competition, and strong national security.

The AI Action Plan is a key opportunity to drive innovation by eliminating unnecessary government constraints and enhancing U.S. leadership. Policymakers must act decisively and avoid burdensome regulations that favor large tech incumbents and instead foster an industry-driven ecosystem that establishes a global standard that promotes American innovation.

America should focus on preventing ideological bias, adding security standards to AI, protecting data rights, and establishing clear standards without stifling the free-market forces that drive innovation breakthroughs.

Key Policy Recommendations:

1. Preventing Ideological Bias in AI Training

AI systems should be ideologically neutral, ensuring that liberty, free-market principles, and open inquiry remain core to their design. Training datasets must not embed partisan, anti-American biases that distort historical facts or suppress legitimate viewpoints. An independent industry standard for ideological neutrality should be developed. If this is not achieved, then it should be accomplished by legislation. Preventing bias will preserve public trust in AI models while preventing distortions that can adversely impact society.

2. AI Filtering and Free Expression

AI models should remain largely unfiltered, except in extreme cases where content poses imminent harm. Allowing filtered models to become the norm risks enabling censorship creep, shifting from minor distortions to the suppression of historical facts and political realities – as seen through China’s DeepSeek. Likewise, the question of whether open-source models should allow user-controlled filtering is crucial and deserves further exploration.

3. Protecting AI Model Architecture for National Security

Communist China’s brute-force reverse-engineering of American innovators to create DeepSeek underscores the need to secure model weights and proprietary architectures. America must take proactive steps to prevent adversarial state actors from exfiltrating sensitive AI innovations while maintaining an open, competitive ecosystem for domestic research and development. Policymakers should engage with industry leaders to create robust security frameworks that balance IP protection with continued innovation.

4. Data Governance, Privacy and Security Standards

Strong data governance and security standards are essential to protecting individual privacy, preventing leaks, and safeguarding sensitive AI components. Policies should avoid regulatory overreach while promoting industry-led protections for consumer data and national security-sensitive datasets. Additionally, AI workflows should be segmented to mitigate risks, with clear industry standards preventing unauthorized model distillation and knowledge transfer. Rather than imposing rigid mandates, the government should encourage private-sector adoption of security measures, ensuring AI systems remain both secure and innovative.

5. AI Accuracy, Error Rates, and Hallucinations

The potential for harm is too great if LLMs provide inaccurate answers once AI has achieved greater adoption throughout the economy, making it essential for the industry to establish self-regulating mechanisms that ensure AI reliability. LLMs should have built-in checks and balances, using agentic workflows to vet whether they have hallucinated or lied, and inform users of such errors. Standards around error rates and hallucinations should be considered, but they should be market-driven, not overseen by the government.

These recommendations uphold the Executive Order's intent of removing barriers to AI leadership, preventing ideological capture, and fostering innovation through free markets while protecting our national security interests.

Conclusion

Free markets, fair competition, and robust national security continue to help keep America great. By resisting regulatory overreach, creating security standards for AI, and enforcing ideological neutrality, the U.S. will dominate AI and continue leading in this wave of innovation.

I urge policymakers to prioritize innovation-driven solutions while ensuring AI remains secure, unbiased, and aggressively aligned with American values. Thank you for your time and consideration.

Sincerely,

Alec S. Jones
