General Comment

Generative AI is exploitative software designed to reproduce outputs from its datasets. These datasets include copyrighted material from a myriad of sources—uncredited and uncompensated from unconsenting laborers.

By virtue of the nature of its development and its function, it directly competes against the very creatives whose works are required for it to function. It has already negatively impacted said creatives by forcing them to work longer hours with fewer coworkers for less pay in more standardized settings. It's also directly slashed pay and job opportunities for freelancers. Text-based genAI software also siphon traffic from the very sites whose information they regurgitate.

In addition, many tech companies directly profit from these software, whether from donations from larger companies or from subscription services.

Because of this, it directly violates the Fair Use affirmative defense. It's also why tech companies keep insisting to change copyright law—they're fully aware that it violates the civil rights of laborers from multiple industries.
