General Comment

I am strongly against the idea of taking most forms of AI generated material any further.

An inherent flaw of AI generated material is that it can not intuit or create anything on its own - it MUST have material fed to it AND be told what to do with it in order to make anything to begin with. And especially without any regulation on it, this will and already has led to bad actors just taking anything they want (including copywritten material) and using it to train their AI - often without permission or even credit.

With this in mind, regarding creative mediums (art, music, movies, etc.) this means that AI will and has generated material directly built off the works of others, with very little to no meaningful remixing or artistic intent.

Regarding research-related fields, it has also already been proven to be problematic due to AI's inability to truly intuit, research, or verify anything it's saying. Depending on the coder's intent, an AI can flat out lie, build info based on incorrect but accessible information, or stretch the truth in some way to make it sound better for the client, all of which can/will/do cause issues for anyone trying to research a subject.

While AI can be a powerful tool in certain contexts (such as simple language translation, making video editing a smoother process, or helping certain people audibly speak) it is also a tool that, unchecked, can very easily take advantage of others' work, misinform both intentionally and unintentionally, and make it harder for people's voices and works to get out there in a sea of AI generated copycats and low-quality work. Should AI technology still be pursued despite all of this, I firmly believe it should be held under scrutiny to make sure it does not further go down the path of simply exploiting the hard work of passionate and dedicated artists and researchers.
