General Comment

I believe that AI has a place in helping humans do things that they are not good for; investigating gigantic data sets, working through thousands of iterations of a problem quickly, or reviewing streaming data for patterns in real time.

I believe that AI is best suited towards narrow applications - look at how protein folding has been pushed forwards by leaps, or how we are actually using it to find lost civilizations by looking at satellite data.

Humans are very good at the arts. They are very good at writing creatively. These are the things that moved our culture forwards, expanded our minds. AI can mimic this, but it can never replace it. It's always "is this good enough?" while presenting a vision that is, on the surface, acceptable, but a deeper review shows the flaws and betrays the human contract between art and artist.

The only reason to replace art with AI is to save money. It isn't to advance the human race.

The only reason for a human to abdicate their agency and intelligence to an AI is to save money, and to make the dumbing down of society more fiscally palatable.

Anyone working with AI should be keeping this in mind - that there are actions and behaviors that make humans what we are - creative and intelligent. Abdicating our humanities is the first step towards extinction.
