

PUBLIC SUBMISSION

As of: March 21, 2025
Received: March 15, 2025
Status: [REDACTED]
Tracking No. m8a-lfh9-dibv
Comments Due: March 15, 2025
Submission Type: API

Docket: NSF_FRDOC_0001

Recently Posted NSF Rules and Notices.

Comment On: NSF_FRDOC_0001-3479

Request for Information: Development of an Artificial Intelligence Action Plan

Document: NSF_FRDOC_0001-DRAFT-2395

Comment on FR Doc # 2025-02305

Submitter Information

Name: Anonymous Anonymous

Email: [REDACTED]

General Comment

OpenAI, and by extension, generative AI doesn't have a place in the future of the US. AI companies should be held to the letter of the law and not get to use the works of American workers without any compensation. Generative AI offers little to no benefit to the future of this country. Much of the prospective use touted by OpenAI is technology that already exists and isn't made more efficient with the use of generative AI. Large language models (LLMs) cannot be used to replace human writers. They have good use for functions like text suggestion, which is a very limited tool in and of itself. Any communicator/author regularly using generative AI will make themselves reliant on a tool prone to error and only trying to make suggestions. AI does not *think*. An important distinction between an algorithm and a full human mind is that the algorithm is not thinking. It can be a seemingly close logical simulacrum to thought, but it is effectively fulfilling a set of directions/formulas basing its answer on previously provided data. AI can only reshape data, human minds do much more than that. Creative inspiration is practically divine in how weirdly organic it is. The line drawn between creativity and logical thinking is a huge misconception. Both feed into each other. One can easily examine that emotional motivation drives both in people. AI cannot feel, thus it can't think. It can be a good tool for needing something parroted rapidly, but it cannot grasp context and build upon a real lifetime of lived experiences to understand the situations it's solving or to come upon inspiration.

AI will not lead to prosperity for anyone. It is a tech buzzword that tries to conflate a ton of different technologies and industries under one moniker and ties it to a specific new kind of technology, that of generative AI/generative content models. These models have shown no practical benefit outside of extremely small use cases. All corporations that have tried to integrate AI into their products and pushed their advertising to showcase it have had a ton of backlash, confusion, and disinterest. The American public does not care about AI. Those who do are, for the most part, vehemently against it.

The only action the federal government should take in regard to generative AI is protecting the American workers it seeks to replace and the works of media by American creatives AI seeks to use without compensation to replace said creatives.
