General Comment

The US framework for AI development ought to adhere to certain core principles to ensure all Americans share appropriately in any ultimate benefits:

1. Recognition of rights to individual data privacy and ownership of data that may be used to train models, including voluntary opt-in (rather than opt-out) legal structures, structures for compensation of creators of data used for training, and equitable remedies for infringement on individual rights that include requirements to make models trained on illegally acquired data free and open to the public.
2. Energy consumption reduction, carbon neutrality, and environmental harm reduction, including requirements for the use of green energy for new data centers, prohibition of infringement on public water sources, and requirements that chips manufactured in or imported to the US be built using materials from more-sustainable mining operations.
3. Adherence to human-based decision-making and liability as AI is implemented to support government and private roles, including securities trading, vehicle operation, all categories of SIGINT and surveillance, law enforcement, and military applications. The law must hold humans liable for actions in all circumstances, whether the person operating and acting on advice from an AI program assistant or, in cases where an AI's advice or actions are not actively verified by a human in real time, the humans who have trained or built the AI in question.

All three of these principles will tend to make AI development more costly and challenging. However, the alternative will be a future in which all Americans feel the harms of AI development while only the few will reap the rewards.
