General Comment

Generative AI is incredibly harmful to the future of many of our industries, not only in the creative field but in advertising, PR, HR, and many many others. The creative industry and others associated with it is just the first on the chopping block with the widespread use of generative AI. Innovation depends on and is utterly completely founded on the influx of new, fresh ideas to build upon even more new, fresh ideas. Generative AI guillotines the continuous addition of actual new innovation by just recycling amalgamations of ideas, art, and just general stuff that already exists to be beheaded and sewn back to something else before spat out to the public. It is dishonest, it cheapens the work, and most importantly it removed the human aspect from the things we love in our lives and from the passion we put into our work.

To appeal to a different side of the argument, Generative AI also leaves more room for errors. Trained individuals who are specialists in their careers in things like design, writing, art, and personal interactions with others can be prone to simple mistakes, but with time and training large mistakes are far less likely to slip through the cracks. With the use of unregulated AI that is run by people with little care nor knowledge on the subjects or fields they operate in, how are they going to be able to tell when the AI might make a mistake? Generative AI programs have been known to grab false information or harmful content from the internet, telling people things like it being ok to mix bleach with ammonia or displaying instances of child pornography. Even recently an AI-generated video of the president was displayed in public committing indecent acts. This is horrifying and should not be welcomed into corporate or legal spaces. We as people have to be able to trust that knowledgeable specialists are doing their jobs and can take accountability for any mistakes that a human could make. Who takes responsibility if an AI messes up?

This comment and opinion piece was 100% human-made without any assistance from an AI writing program.
