General Comment

The solutions suggested do not provide any feasible input for the betterment of Artificial Intelligence in America. Commercial solutions for artificial intelligence are being forced without consideration for large scale deployment, without careful planning will ultimately result in collapse and recession before any goals can be reached.

America lacks critical infrastructure with redundant models for producing Artificial Intelligence models. The existing solutions come from data centers currently owned by individual corporate interests, who as we speak are divesting their American interests in favor of America's rivals.

Further, current models being presented for the general public are built on theft of intellectual property. Make no mistake that other industries in America are actively being poached, and their work is being stolen. Continuing violations of these rights will create public distrust in AI Models as a whole - trust which is necessary for the consumption and continued success of these models.

This, combined with saturation of the market that will advance as a result of looser regulations on artificial intelligence, will result in the rapid deterioration of quality of results produced.

These holes in artificial intelligence coverage are well understood, and disregarded by industry leaders who, as stated earlier, do not have the future of this country as the forefront of their interests.

But enemies of America are fully aware and ready to exploit these shortcomings to ensure our failure in the field of Artificial Intelligence, while their own models succeed unimpeded.

The success of Artificial Intelligence in America and our positioning as leaders in the upcoming race for AI requires full trust, investment, and approval from the public first and foremost. That will require decisions be made that go against the better interest of industry; if those cannot be made clearly and with strict consequence, then America will see our lead deteriorate as the rest of the world develops these solutions for themselves, with careful acceptance and regulation from participating countries, using the infrastructure that we lack.
