

PUBLIC SUBMISSION

As of: March 21, 2025
Received: March 15, 2025
Status: [REDACTED]
Tracking No. m8a-n3ga-liw9
Comments Due: March 15, 2025
Submission Type: API

Docket: NSF_FRDOC_0001

Recently Posted NSF Rules and Notices.

Comment On: NSF_FRDOC_0001-3479

Request for Information: Development of an Artificial Intelligence Action Plan

Document: NSF_FRDOC_0001-DRAFT-2516

Comment on FR Doc # 2025-02305

Submitter Information

Name: Bennie Nelson

General Comment

Many search engines and social media providers are notorious for employing algorithms that block or mask "undesirable" viewpoints and data, while favoring or prioritizing others. In addition, the Internet has been greatly polluted with fake news, counterfeit histories of America and Americans, and so forth. To name but a few, consider the enormous number of reports regarding: the Russian Collusion Hoax; the letter from 51 senior intelligence officials; the Charlottesville Hoax; the BLM/Antifa riots being described as "mostly peaceful" while cities burned; Hunter Biden's laptop being called a hoax; and the many revisionist histories of the Founding Fathers and the American Revolution. In short, data corruption and alternate histories are prevalent on the Internet, in school curricula, in books, shows, movies, and so on.

Combining such corrupted data with biased algorithms provides powerful weaponry for those who want to undermine America. In other words, an AI developed for global dominance can be hijacked and weaponized for use against America and Americans. To prevent this, carefully constructed and implemented governance and accountability are required for both the code base and the data. History provides an example in the project commissioned by King James I of England to translate the biblical texts from the original languages into English.

To summarize, the translators were divided into companies to work on specific portions of text. Each member of a company would produce their own version, and the company would review and consolidate these into one rendering of the text. This document was then submitted to the other companies for review and revision. The fact that over 400 years later the King James Version is still widely read and used by many millions of people is a testament to the success of that project and its methodology.

In developing the proposed AI, it is proposed that integrity reviews be built-in to the development process so that new code and code revisions are reviewed by different teams from the developers. For example:

- Developers are divided into teams.
- Each team is assigned code to develop.
- Each member of a specific team writes code in parallel to the same specifications.
- The programs are tested in parallel and the results are validated against each other.
- The program code and results are submitted to the other teams for integrity review.

A similar process should be employed for building and maintaining the data store that will be used by the AI. There should also be a feedback loop allowing the American Public to report faulty or suspect data and/or results.

Finally, the governance structure of the entire project should also have checks and balances so that the authority over the AI cannot be usurped in order to weaponize AI against America and the American people. Finally, the governance structure should not be overly centralized, since a highly centralized structure is most likely to be abused.
