General Comment

While I understand the concern with international developments on this technology, the current approach is being done with a very short-sighted view. The original developers and researchers of what we call artificial intelligence have long warned us against using it without much restriction. There are better approaches that can be done to continue development without harming American people and American culture.

We need to keep things that involve and require human experiences and judgement to humanity. We are already seeing negative impacts against Americans by using this technology to circumvent processes that need human judgement. This is seen in many jobs right now where Americans are getting automatically rejected regardless of whether they qualified or not, since these applications are being processed as variables rather than for qualifications.

We will also be degrading American culture by leaving everything to computerized ideas, which cannot live full lives as Americans to enrich us and show the world who we are. Everything that defines us will be jumbled into a game of telephone by a computer based off of calculated inputs, rather than have us defined by Americans with rich and different lives that can bring pride to our country. A computer can be completely copied while a skilled American cannot.

Because these are computers as well, they can easily be manipulated and worked around and we are haphazardly leaving judgement onto these devices. We have already faced great cyberattacks in our country with data breaches, who is to say our Artificial Intelligence cannot be tampered with by another country to harm us? We are already having issues protecting our systems and this technology is far too new to rely on it.

However, This is to not say we do not need Artificial Intelligence whatsoever and that we need to handicap ourselves based off of these concerns. There is ways it can still be develop and I urge the United States to take some time to think about their strategy thoroughly rather than with haste. There is a long history with this technology that is being overlooked that should be a factor into this decision.

I believe as a way to continue development and to use this technology to its full, true potential, we need to be focused on its use mathematically, just like any other computer technology. We can greatly use this technology to speed up progress in other developments in other industries, without completely replacing those jobs. For example some industries require very lengthy calculations as a part of the job, which can be sped up greatly with the assistance of AI. We can use this technology to enhance our current algorithms in our infrastructure, which wouldn't affect jobs as those algorithms are already written down and tend to be set in stone.
