General Comment

"...ensure that unnecessarily burdensome requirements do not hamper private sector AI innovation."

The primary "Artificial Intelligence" uses I'm familiar with at this time are the "generative AI" processes that produce nonsense text, incorrect answers to common knowledge questions, and overly-glossy but fundamentally bad "art" images. These generative AI programs use astronomical amounts of water and power that could be better spent in other areas of industry. Many of them have also been "trained" on copyrighted works, of which the copyright holders did not consent. (And despite all of that, the results are still bad! What are these companies even doing?)

If anything, I think AI needs MORE burdensome requirements! I think AI companies need to respect American copyright law and manage their utilities and resources better!

Stripping existing regulation or preventing new regulation will cause "AI" to develop into an even more useless, lazy, inefficient technology. The requirements and regulations are the things that will drive innovation. The place to innovate is in efficiency and ethics.
