General Comment

America does not need a stronger generative AI policy - generative AI programs are a massive waste of resources, being inefficient and producing mediocre to bad results, and gutting copyright to allow generative AI companies to steal data and creative works at will is a great way to chill actual scientific and artistic progress in the United States. The reality of generative AI is that it's a probability machine, a stochastic algorithm that generates a series of words, images, music, etc. that are related to some input. If I'm working on a paper about a scientific field, and I ask a generative AI program to make a bibliography, it'll throw out the names of papers, researchers, and journals that are associated with the field I'm interested in. Whether or not those words make any sense together, whether or not the thing those words are describing actually exists, is an entirely different question. There is no "mind" behind a generative AI program that knows the difference between a truth and a lie, and generative AI programs are by nature uncreative. As such, putting these programs in charge of national security and database management is incredibly dangerous, and has the potential to do lasting damage to America's stability and security. Furthermore, the companies pushing generative AI programs have massive financial investments in those programs, and it frankly seems like they're trying to use the United States government as a piggy bank to line their pockets. Even in calling these programs AI, when there's nothing intelligent, no "mind" behind these programs, it's obvious that this is a scam. I'm also worried about the scientists, artists, engineers, and entrepreneurs who will have their copyrighted work stolen by these for-profit companies. How are we supposed to create anything, why would we want to create anything, if our work is just going to be used by companies who'll sell it off to the highest bidder? This policy seems to be a great way to strangle real creativity in the cradle, while driving up utility costs due to the massive amounts of electricity and water that generative AI programs need to function to badly ape that creativity. We need better policy than this.
