## General Comment

While I believe there is value to be had in AI technologies, the argument by leading generative AI developers that they must be exempt from existing copyright laws is absurd. If your product relies on the work of others, and you can't afford to compensate for that work, then you don't have a viable business plan. There are real advancements being made that don't rely on violating copyright that are getting crowded out by people with an attractive sounding pitch but nothing to back it up. Providing exceptions will only serve to prop up the companies who don't have anything to provide but the repackaged work of others while further sidelining the work that can truly put us in a leading position in developing technologies.
