General Comment

The methods in which OpenAI and Google plan to collect training data is absurdly anti-competitive and generally unethical. This proposal is effectively granting these companies special exception to blatantly violate copyright law and fair use. Even if other AI companies were allowed to freely use copyrighted materials in their training models, the lack of compensation for the original creators of the training materials would disincentivize creating any further material at all. AI models cannot create new material in the same way humans can and must constantly rely on a continuous source of data. The quality of their models will decay over time without this.

Should Google and OpenAI be granted this exception, it would lead to them becoming a large scale monopoly, stifling any further innovation in not just the field of artificial intelligence but in all creative media. It is a blatant double standard as well. I'm certain both Google and OpenAI would take issue to their own data being used for training by a rival AI company.

If these companies need to gain an unfair advantage in order to remain competitive, then they need to reconsider how they are running their business in the first place. OpenAI and Google is effectively asking all creatives across the United States of America to work for free. That does not exactly sound like a free market capitalist society. This is made worse so as these companies do not necessarily have the best interests of the American people in mind when they are deprioritizing quality of service.

Google in particular is already making Internet searches difficult by limiting the results you want to see as well as giving incorrect, biased information as well as prioritizing advertisements over accurate information. Effectively, they are also limiting free speech and a person's right to public information.

Future AI laws need to prevent this disastrous scenario from happening.
