Comment On: NSF_FRDOC_0001-3479

Request for Information: Development of an Artificial Intelligence Action Plan

Document: NSF_FRDOC_0001-DRAFT-2748

Comment on FR Doc # 2025-02305

Submitter Information

Name: William Guido

General Comment

Dearest reader,

I have followed the development of AI (specifically, generative AI models) since the first ever public release of Dal-E. At first, the concept of generative AI as a whole, a process that could aid in human creation was groundbreaking. I and many in the field of technology were very interested in what potential paths this could open for not only those interested in computer science, but artists and musicians as well. At first, I used these generative AI models to create inspirations for cityscapes, skylines, etc. It made the creative process fun and inspired, but that all changed as generative AI became more widespread. We saw AI turn from a simple tool for inspiration, to a force that eliminated the jobs of millions of artists, both professional and aspiring, and flooded not only the online, but the physical world with "art" that lacked the very essence of human creativity and labor as a whole. Art is what makes us, as a species, unique. When we look at past cultures, one of the biggest ways that we see their existence is through their art. Consider the ancient Roman and Greek empires, with paintings and books that laid the groundwork for our current movies, films, and more. Without art, humanity isn't so human. And that is what currently is happening. I'd estimate that about a quarter of the internet, its videos, images, and texts, are generated entirely from AI. When we have that big of an influence, who knows what could happen if the smallest mistake happens in relation to the "thought-process" of AI (which, as a reminder, we haven't the slightest clue of how it might work. See the "Black Box" effect). As a 17 year old perusing a career in cybersecurity, my, and many other's perception of the future is bleak. It is more than a possibility that, if it continues on its current trajectory, AI will steal jobs from not only art majors, but from computer science, journalist, English, architecture, music, and math majors as well. I beg you to consider this; if tariffs are being placed to increase jobs and prevent external importation, AI should be restricted as well. If AI continues to grow, eventually it will consume all jobs, leaving America, and possibly the rest of the world, in a state of poverty with a few select elites, primarily those behind gen AI, at the top. If we continue to create flawless, intelligent beings, what will happen to those who have flaws? What will happen to the entire, human race. We are going beyond technology at this point. Please, listen to the people of America. We are scared, concerned for not only our future, but the future of humanity itself. And there is nothing we can do but hope and pray.
