Received: March 15, 2025
Status: [REDACTED]
Tracking No. m8a-qo4s-pd2f
Comments Due: March 15, 2025
Submission Type: API

Docket: NSF_FRDOC_0001

Recently Posted NSF Rules and Notices.

Comment On: NSF_FRDOC_0001-3479

Request for Information: Development of an Artificial Intelligence Action Plan

Document: NSF_FRDOC_0001-DRAFT-2863

Comment on FR Doc # 2025-02305

Submitter Information

Name: Peter Paralikas

Address:

General Comment

As an engineering student graduate, someone with a masters in Cybersecurity, and a regular navigator of the internet, I very strongly argue against the idea of overturning Executive Order 14148. The protections pushed in that order affected IPs across all industries

Regardless of that, as a new plan for the USA's AI initiatives is formed, there are a number of areas that CAN be focused upon and improved. Improved analytics, a focus on research in the tech field, where generative ai focus could instead be turned to a focus on the simulations instead.

And of course, regulations for the industry as a whole - both on AI, and on cybersecurity. I have an entire thesis I wrote describing key directions the federal government could approach on this, such as, enhancing the current standards companies are held to, with tiers based on the size. Properly setting fines for not just failure to meet standard, but also for each and every person who was affected by data breaches, putting in place definitive penalties for selling user data or collecting it when not necessary, and establishing requirements and security checks that must strictly be followed if working on a government project.

However, I would argue against any efforts to enhance generative AI. As stated even a this past February by the CEO of Microsoft (<https://ca.finance.yahoo.com/news/microsoft-ceo-admits-ai-generating-123059075.html>), Generative AI has no real value. It is an expensive tool, one that requires so much data that it can't be fully fed on all of the internet, costs incredible amounts of energy to maintain.

And of course, there is the known fact that generative AI uses owned IPs and original work to 'create' new art, stories, images etc. However, while OpenAI and similar companies will say that this is not theft, they are more than happy to point the finger at other companies who make waves in the GenAI field for the same (<https://www.latimes.com/business/story/2025-01-30/column-openai-accuses-china-of-stealing-its-content-the-same-accusation-that-authors-have-made-against-openai>).

If the US government wishes to focus on generative AI, I would argue its best choice would be to developing the technology to RECOGNIZE IT. Our enemies abroad will certainly be utilizing it in the future for propaganda. We should be prepared to call it out, and prove it is a false creation. This also doubles as a protection for the American people from abuses and fraud that has already begun in the industry (i.e. generated images of food, products etc, selling the 'concept' of an idea).

Hopefully, whoever reads this comment takes to heart how important our cybersecurity is over the idea of spending billions on the tech-world's latest craze.
