General Comment

I am a programmer. I work with AI as part of my job, at the insistence of my superiors. The current most popular branches of AI development produce shoddy output, sometimes even dangerously so depending on what it's being used for, are over-promised on what they can reliably accomplish or what they could ever hope to reliably accomplish, leading to many users and investors putting unwarranted faith and sometimes money into the products. This shoddy output is on top of training via rampant copyright infringement and a complete disregard for intellectual property, sometimes purposeful and targeting in attempts to infringe on a particular creator's unique style. They're anti-competitive, as they produce low-quality output at a subsidized and unsustainable cost, using predatory pricing practices to force the creatives that they stole their training materials from to either also drop to unsustainable prices or fold. They're harmful to the environment, wasting large amounts of natural resources to accomplish tasks that could've been accomplished much more simply and with much fewer resources by paying a human to do so. I believe there are valid and useful places for AI to be used, but at present the most "lucrative" options, which are only lucrative thanks to a bubble, falsified advancement trajectory, and lax government oversight, are a scam in progress, with creatives already feeling the burn and the collapse inevitably soon to reach executives. AI should be more strictly regulated to ensure these companies aren't scamming investors and consumers alike by over-promising or promising things their product can't accurately accomplish, that their training is done ethically, and that the pricing accurately reflects the cost of business; that they're not using anti-competitive pricing strategies with plans to increase prices once they achieve market dominance.
