Status: [REDACTED]
Tracking No. m8a-tpoc-8685
Comments Due: March 15, 2025
Submission Type: API

Docket: NSF_FRDOC_0001

Recently Posted NSF Rules and Notices.

Comment On: NSF_FRDOC_0001-3479

Request for Information: Development of an Artificial Intelligence Action Plan

Document: NSF_FRDOC_0001-DRAFT-3284

Comment on FR Doc # 2025-02305

Submitter Information

Name: Daniel Shumway

General Comment

Modern LLMs are a scam. They're not useless, but they are far over-hyped for their capabilities. Every consumer product I have seen with LLMs performs worse than is promised. Prominently hyped products like the Humane pin literally went under their AI integrations were so bad. And they are all wired up to ChatGPT and similar.

These things DO NOT WORK - not to the degree that anyone is promising, and there is no indication that they are going to get better. OpenAI has been throwing more and more data at their stuff for marginal-at-best improvements. They have no plan. They are selling a fantasy.

Which, fine, who cares? Lots of tech is over-hyped and doesn't work. It's only a problem when massive amounts of the economy get dedicated to these scams and the owners of these scam companies get given huge amounts of legal privileges to prop themselves up as essential when in fact they are just burning everybody's cash.

That's what OpenAI, Microsoft, Anthropic, Meta, and all of the others want.

Sam Altman is a scammer. Period. His last scam was an orb that scanned your eyeball. That eventually burnt up, so now his latest scam involves getting billions of dollars of investment capital (often subsidized by consumers and taxpayers) while committing widespread copyright violations and outright piracy - and now he's out saying that without permission to ignore copyright law the AI race is over.

There is no AI race. This. Crap. Doesn't. Work.

Apple just had to do one of its first product delays in (I think) over a *decade* because this crap doesn't work. Apple shipped features around AI summarizing news articles, and had to *remove* them from their operating system, because this crap doesn't work.

AI doesn't need investment or careful stewarding. Instead, the companies propping it up even though consumers don't want it and even though it produces wildly unreliable output - those companies need a bucket of cold water poured over their heads so that they can wake up and come back to reality with the rest of us.

They definitely do not need copyright exemptions. Meta is facing a lawsuit for straight-up piracy - torrenting copyrighted books, seeding the downloads - this is a thing people have gotten thrown in prison for. Why on earth should Meta be excused from the consequences of blatantly violating existing law? Because they released an LLM that doesn't really work well and that got immediately got overshadowed by China's LLM that also doesn't really work well?

What we need from the government right now is recognition that this is a bubble that has the potential to bring down the entire tech industry, that no one is actually making money off of this, that it is wildly insecure, and that consumers don't want it - and that the government does not need to subsidize or support this waste of money. We're in the middle of cutting the education department, we don't need to subsidize Mark Zuckerberg or Sam Altman. And if we're going to revise copyright law, there are ton of areas (right to repair, data

portability, digital preservation) that would be better to focus on - areas where we could actually solve US problems.

Of course, what Sam Altman and his ilk are threatening is that China will "win the AI race."

First off, they're not going to. But secondly, if they do, then *LET THEM*. This is like having a race to see who's fastest at eating a sandwich made of poop. The winning move is to stop eating the sandwich.

The technology being pushed here fundamentally cannot be used to build AGI. It is not possible. And there is NO indication that the technology is going to get much better than where it is now (at least not any time soon), and no indication that the fundamental problems with inaccuracy, context loss, and security are ever going to be solved. Any country that is staking its future on this technology is *stupid*. And if China wants to be stupid? Let them be stupid. It is only to our benefit.

What we need to be focusing on as a nation is how to shield workers and the stock market when all of the tech companies stop being able to pretend that this is anything other than unprofitable. The bubble is going to pop at some point; virtually no one is actually making money off of AI, and the new model releases keep getting more and more disappointing.

An AI strategy that is good for America should be about reducing the impact when that bubble pops. We certainly do not need to invest more resources into it, and we certainly do not need to subsidize or sponsor its development, and we certainly do not need to give companies like Meta and OpenAI licenses to violate existing copyright.
