General Comment

While AI's pattern recognition abilities have useful applications in fields like medicine, generative AI is incapable of producing anything of value, only serving to fill Google results and email inboxes with white noise garbage that people will ignore. It has massive security issues and very little value.

People do not want human-made art replaced with bland nonsensical grey mush. This is something being blindly pushed by out-of-touch tech leads and CEOs who think it's a good way to get out of paying real Americans to create movies and other media, but this only shows that they do not understand their product or their customers. Giving them carte blanche to run roughshod over copyright laws that exist to protect American ideas and innovations will not change the fundamental flaws of AI and will not convince American consumers to go see movies with banal, thoughtless predictive text scripts and uncanny corpse-like "actors" whose faces morph between scenes.

Do not devalue the work of the great American people to feed this pyramid scheme. The generative AI bubble will inevitably pop regardless of how many dollars and freedoms you shovel into the engine. No need to allow it to cause even more damage before investors inevitably get wise to the scam.
