General Comment

While generative AI's base to detect what images are has been useful in science, it doesn't need to ability to recreate images, video, writing, coding, speech, or music.

The first problem is copy write exists to protect creatives and their work. Taking their work to create a copy is plagiarism. Even though these are not items that cannot be copy right-able, it still takes money from creatives by offering a cheap imitation of their work for less money and effort. This would cause more economic problems for artist of all economic walks of life.

This also doesn't stop people from generating images, video, writing, coding, speech, or music and claiming that whatever they made isn't made by AI.

The second problem is there is already no consent to the images being taken. Actual protects are limited and there have already been many lawsuits over generative AI's legality for the lack of protections. This technology is decisive, and by endorsing it, the USA Government is inviting lawsuits that will take up time and money.

Lastly, with generative AI models like Deep Seek, that are free, the bubble for generative AI has burst. Trying to revive it by handing it materials the USA has protected to the letter of the law up until now is a mistake. Companies are just tricking the government for a hand out that will go up in smoke and dissappear with these companies that cannot stay afloat. By disregarding the law to allow this failing business venture to survive for a little longer, the USA will undermined its own legal authority. With how the USA's judicial branch in the current state it's in, is it a good idea to keep bending it further? This branch of the government is important, and if it should break, the USA government will lose all authority it has over its citizens and its standing with other similar nations.

In short, this is a bad idea that ignores the law and will only end in judicial failure and lawsuits by some of the biggest companies within the USA. Don't.
