

PUBLIC SUBMISSION

As of: March 21, 2025
Received: March 15, 2025
Status: [REDACTED]
Tracking No. m8a-vd2z-qz5h
Comments Due: March 15, 2025
Submission Type: API

Docket: NSF_FRDOC_0001

Recently Posted NSF Rules and Notices.

Comment On: NSF_FRDOC_0001-3479

Request for Information: Development of an Artificial Intelligence Action Plan

Document: NSF_FRDOC_0001-DRAFT-3551

Comment on FR Doc # 2025-02305

Submitter Information

Name: James Newsome

General Comment

To allow AI to use copyrighted materials, or any materials that are used without permission from its living creator in its training would amount to a showing that the law in this nation only applies to those without the money to get around it.

And the end result of this, should it be allowed, is a product which is full of promises and little else. The salesmen attempting to wow the world with it will claim it can do everything and more, if only they're able to steal more data to use in their models, if only they're given another billion dollars, if only they're given another few years, but they have yet to provide a single genuine use case. Famously Google's AI shows this with how it will tell you that two kilograms is less than two pounds, despite going on to mention that one kilogram is the equivalent of 2.2 pounds, or how Africa has no nations starting with a "K", and how "Kenya" merely appears to start with one (which they seem to have manually removed out of embarrassment).

They fail time and time again to find a problem for their "solution", all the while tricking the less technically knowledgeable with their use of "AI", trying to make us honestly believe there's anything intelligent about it.

The consequences of allowing this technology in its current embarrassing state to steal the work of the working class so the owners of this tech can fire them would be disastrous for not only those fired, but for the future workers hired as well. Microsoft itself has already come out with a study showing that the use of these applications only serves to harm the development of skills needed in a healthy workforce. We would effectively be chopping down all the trees in a forest for lumber without considering that we may need more later, instead focusing on making the profits soar right this moment, with no regard for what happens after. If the workforce isn't allowed time to develop skills (through understanding what they work on) and are instead forced to use AI for a shortcut in everything, then not only will the rather lackluster AI be the only thing capable making anything, but when it inevitably breaks, there will be no one around who knows why or how to fix it.
