General Comment

When considering an AI Action Plan for the nation, A couple of things that I have to address is the need for proper and ethical training of AI systems and cojoined with that thought is the preservation of Intellectual Property and Copyright.

Any AI system that could have beneficial merit must be trained on data that is owned by the organization developing the technology, or using information expressly given to it by contributors. This training must be rigorous to avoid errors; sometimes taking months or years of development and rigorous testing. Recent events with software technology, such as the 2024 CrowdStrike Incident serves as a grim reminder of what can happen when even seemingly dependable systems have a critical issue. The AI technology must ensure that factual and beneficial information is given at all times. Any AI system that gives out any information that could be considered faulty or spurious casts a dark shadow on the technology as a whole, and there is information publicly available detailing serious errors and omissions made by various AI systems available today that was not thoroughly developed. An expansion of AI into everyday life will impact Americans in more negative ways than positive ones unless there is a foremost effort for all private and public AI technologies to use quality data that is developed by the AI developers themselves or contributed by trusted sources and cultivated for the best uses in stability and security.

A major concern that goes along with the previous statement is the potential for any AI developer to use any information without regard for previous established uses of Intellectual Property and Copyright law. Many Americans, both individual and as parts of Corporations, rely on Intellectual Property and Copyright law to protect their intellectual investments. Any AI Action Plan that is developed in this country needs to ensure that carte blanche is not given to any AI developer that would infringe on the rights of practically every American for its own benefit. If Intellectual Property and Copyright law is weakened any way by this action plan, that will cause severe IP issues and set off years of legal strife in many Intellectual fields such as Art, Music, Motion Pictures, Interactive Entertainment, and this would reach into Software Development also, including AI technology, just to name a few industries out of many if any AI developer has overreach into information that it does not intellectually own. The Copyright Office recently has stated as a part of their policy that it must uphold the human requirement for any works created, even if it has been created with AI and that should be upheld and protected for the good of many Americans that have benefited this country through their creative efforts. I strongly urge the policymakers that read this to consider these points to ensure that any AI technology developed in this country is trusted, reliable, and respecting of the rule of law in its ongoing development.
