## General Comment

Generative AI has no valid uses whatsoever, as its only way of existence is by unethical theft of data produced by actual humans. It then mashes this data up and regurgitates it without regard to accuracy or truth, because it is fundamentally incapable of discerning meaning in its input or output. If you've ever been annoyed at your phone thinking you talk about ducks when you're angry, you are watching the small scale version of the process that an AI uses: matching its data to what it thinks is a best fit, ignoring what's actually going on - regardless that it likely already knows how to spell the word you wanted. To make matters worse, the programmers of the autocorrect have trained it that the word that resembles "duck" is improper, therefore it should never be suggested. This brings up additional problems with AI - whoever handles the data set can determine to a large extent what comes out, limited only by the AI's inherent stupidity. Want to suppress information? Don't include it in the data set. Want to make child pornography of anyone you want? That already happens! Advances in AI will only make the child porn creation that much more efficient!

And lord help you if you're an artist or a writer, in which case the talentless hacks in silicon valley are clamoring to violate your IP rights so they can burn rivers to make soulless drivel that looks or sounds vaguely like you.

AI is a poor solution with no problems to solve, doesn't work without massive outright theft, and it's unwanted anywhere it's implemented. Make the AI datasets compensate their data sources and respect IP boundaries. If this drives the AI into bankruptcy, then good. This is America. No participation trophies.
