General Comment

Generative Artificial Intelligence (AI), including large language models (LLMs), are unnecessary for American technical or economic dominance, and as currently implemented are largely based on large-scale theft of human beings' intellectual property. Generative AI models are frequently trained on human-created content without the consent of content creators, allowing for replication of creators' intellectual property. This non-consensual usage allows AI firms and their customers to steal jobs from American workers. Moreover, text-based generative AI models such as LLMs frequently output factually inaccurate information that can deceive Americans and even put them at risk through unsafe advice regarding food preparation or medical care. Finally, generative AI requires large quantities of energy and clean water, wasting valuable resources and driving up energy prices for American citizens. The large-scale evangelization of generative AI is frequently based on exaggerations of generative AI's abilities. Any AI action plan should prioritize 1) protecting American workers from having their work stolen for nonconsensual AI training, 2) protecting Americans' safety by ensuring that unreliable generative AI models are never used for any decision that affects Americans' safety (e.g. air traffic control, medical claims, food safety advice, medical advice), and 3) prioritizing the use of America's energy and water resources for human beings over wasteful generative AI data centers.
