General Comment

I am a Software Engineer in California. Working in the tech sector I offer work with AI tooling often.

Due to its prevalence in search I have to look deeper for sources on everything because every once in a while generative AI will return falsehoods. This erodes trust my trust in things generated by it.

Additionally generative AI tooling is removing opportunities from junior developers who need time in the industry to learn the trade. While we won't see the effects immediately this could cause a decline in future experienced Software Engineers that these generative AIs can not replace.

While there is a place for generative AI tooling it should be handled with more care from sourcing it's data models training data in ethical ways (training the models on data that was given with enthusiastic consent) adding in protections for folks who may be displaced by this technology and keeping a bit of a human element in things we do. Generative AI is supposed to take away the tedious part of life and not replace human creativity.
