

PUBLIC SUBMISSION

As of: March 21, 2025
Received: March 15, 2025
Status: [REDACTED]
Tracking No. m8a-xcu4-rqz7
Comments Due: March 15, 2025
Submission Type: API

Docket: NSF_FRDOC_0001

Recently Posted NSF Rules and Notices.

Comment On: NSF_FRDOC_0001-3479

Request for Information: Development of an Artificial Intelligence Action Plan

Document: NSF_FRDOC_0001-DRAFT-4335

Comment on FR Doc # 2025-02305

Submitter Information

Name: Liam Aechoch

General Comment

Do not implement this. It does not, and will not, contribute for the betterment of the people of the USA. In fact, AI is one of the leading negative contributors to our global environmental and public health. In fact, Han et al. (2025) find that "Our findings reveal that training an AI model of the Llama-3.1 scale can produce air pollutants equivalent to more than 10,000 round trips by car between Los Angeles and New York City. The total public health burden of U.S. data centers in 2030 is valued at up to more than \$20 billion per year, double that of U.S. coal-based steelmaking and comparable to that of on-road emissions of California" (p. 1). Additionally, "the public health costs unevenly impact economically-disadvantaged communities" (p. 1). Another negative impact of the increased spread and use of AI in the USA is that it negatively impacts and affects the distribution of power to both the average American home, but also city power grids in general. As investigated in this Bloomberg article (<https://www.bloomberg.com/graphics/2024-ai-power-home-appliances/>) the increased stress on local power grids next to highly populated cities leads to multiple issues with other necessities in the household, such as refrigeration and heating.

Various other facts and bits of information that prove, or at least err on the side of showing that AI is not a sound economic investment, let alone a sector worth legal intervention to allow for the use of copyrighted works:

The United States Census Bureau found that "Only 3.8% of businesses reported using AI to produce goods and services." (<https://www.census.gov/library/stories/2023/11/businesses-use-ai.html>)

MIT Economist, Acemoglu reported that AI will impact less than 5% of human tasks in the economy, most of which are office type jobs that handle things like pattern recognition, which current "AI" is already capable of doing without the need to train on copyrighted bodies of work. (<https://doi.org/10.1146/annurev-economics-091823-025129>)

If you prioritize AI over the lives and the stability of your own people, then the message the government sends the people is that it wants to invest in a parasitic technological gamble with no tangible benefits for anyone.

And finally a quote that expressed the feelings many people have about the situation:

"Acemoglu told me he believed AI is overrated because humans are underrated. "So a lot of people in the industry don't recognize how versatile, talented, multifaceted human skills and capabilities are," Acemoglu says. "And once you do that, you tend to overrate machines ahead of humans and underrate the humans." (<https://www.npr.org/sections/planet-money/2024/08/06/g-s1-15245/10-reasons-why-ai-may-be-overrated-artificial-intelligence>)
