As of: March 21, 2025
Received: March 15, 2025
Status: [REDACTED]
Tracking No. m8a-xwj9-6og1
Comments Due: March 15, 2025
Submission Type: Web

Docket: NSF_FRDOC_0001

Recently Posted NSF Rules and Notices.

Comment On: NSF_FRDOC_0001-3479

Request for Information: Development of an Artificial Intelligence Action Plan

Document: NSF_FRDOC_0001-DRAFT-4685

Comment on FR Doc # 2025-02305

Submitter Information

Name: Anonymous Citizen

General Comment

I am a private citizen. I studied history through school. I write stories and books in my spare time; with the hopes I might become a professional someday. I have friends who are artists, writers, videographers - all varying between levels of small-time hobbyist to full time successful career.

And I firmly believe that the United States Government should not allow AI development companies to circumvent US Copyright Law to scrape increasing amounts of data under the guise of "Fair Use".

Under the protection and security of copyright, both Arts and Academia have reached scope and capability unseen anywhere else on this planet any other time on this planet. It should be the policy of the US Government to preserve this advancement and foster it, not carve that belief apart to allow private sector companies access to dissect and, quite literally, copy those works.

It should instead be the onus of those AI development companies to find new ways to advance. The advent of DeepSeek just earlier this year should make it apparent that their methodology isn't the only way forward; with less information and less investment cost, DeepSeek were able to produce an AI competitive with the furthest iterations of American systems. The solutions American companies have come up with as an answer to this challenge is easily paraphrased as: "We need to do more of the same of what we're doing to get ahead."

An adage comes to mind. "A room full of monkeys and a typewriter will eventually produce a play by Shakespeare."

This has been the development process of American AI. They found that shoving material into their systems to find patterns that produce coherent sentences worked at first - and it worked so well that there was no need to discover any reason to move past it. Opening up the ability for them to get even more data to shovel now doesn't solve the inevitable wall that will come with their methodology when everything has been fed in. Their models don't "learn" anything more than how to take what's put in and recreate it word for word. Copying and Learning are two immensely different processes, and the AI Industry's inability to differentiate that fact is leading them to fall behind in development by their own volition.

The culture and knowledge of America - the beating heart of what it means to be an American - should not be put on an operating table to be soullessly duplicated by a machine that is incapable of actually understanding it. To demolish any respect and agency given to the people in our nation who create will stifle growth or advancement in those sectors, and it'd be solely for the small term, single iteration boost in a new model.

Maybe, just maybe, in their hunt to produce another play by Shakespeare, AI developers should look to actually innovating upon their system instead of trying to take another 1000 rooms worth of monkeys.
