General Comment

I'm concerned about the rising energy costs of training and hosting large scale AI models. While the environmental protections in the US seem to be diminishing under the new administration, the Earth and it's inhabitants still suffer under the every increasing threat of climate change and carbon emissions. In addition, the intellectual property the AI consumes is often not regulated resulting in lots of original work being stolen without proper compensation or credit. Another important area that must be kept at the forefront of AI development is making sure the AI models are safe, secure, and have the proper safe guards are vital to ensuring that AI is useful for people, not a detriment to them. Proper safe guards should be in place not only to prevent sensitive information from being revealed to bad actors, but should ensure that people are aware of the dangers associated with putting sensitive information into AI. Lastly, a college student, I see too many of my peers using AI to get through their classes, letting them breeze through work with little knowledge being applied and eventually rendering their degree useless. This will have grave consequences with the new and upcoming workforce who aren't able to practice the supposed skills they would have learned in college. This is especially true in the younger education system, where students aren't critically thinking about the media being fed to them, not allowing them to think for themselves, and having adverse consequences on their ability to filter information. Due the covid pandemic (and other factors), students are progressing through grades without being able to read, write or understand media properly, which will affect their competency later in life. AI is being used as a crutch rather than a supplementary tool to learn, and this will have dire consequences in the future.
